

# Gpr139 Cas9-KO Strategy

Designer: Xueling Zhang  
Design Date: 2019-8-5

# Project Overview

<b>Project Name</b>	<i>Gpr139</i>
<b>Project type</b>	Cas9-KO
<b>Strain background</b>	C57BL/6JGpt

# Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Gpr139* gene. The schematic diagram is as follows:

# Technical routes

- The *Gpr139* gene has 1 transcript. According to the structure of *Gpr139* gene, exon2 of *Gpr139-201* (ENSMUST00000084650.5) transcript is recommended as the knockout region. The region contains most of the coding sequence. Knock out the region will result in disruption of protein function.
  
- In this project we use CRISPR/Cas9 technology to modify *Gpr139* gene. The brief process is as follows: sgRNA was transcribed in vitro. Cas9 and sgRNA were microinjected into the fertilized eggs of C57BL/6JGpt mice. Fertilized eggs were transplanted to obtain positive F0 mice which were confirmed by PCR and sequencing. A stable F1 generation mouse model was obtained by mating positive F0 generation mice with C57BL/6JGpt mice.

# Notice

- The *Gpr139* gene is located on the Chr7. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This Strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of the gene knockout on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.
