# Knockin strategy

This mice model is made by transgenic technology, and the schematic diagram is as follows:

# Technical routes

- Transcript *Nr5a1*-201 (ENSMUST00000028084.4) is selected for presentation of the recommended strategy.
- *Nr5a1*-201 gene has 7 exons, with the ATG start codon in exon2 and TGA stop codon in exon7.
- RP24-209B18(~160kb) or RP23-461M4 (~181kb) of C57BL/6J mouse bacterial artificial chromosome (BAC) containing the entire *Nr5a1* locus (and other genes), was modified by targeting iCre-PolyA sequence into the BAC replacement of genomic sequence between the translational start site and nucleotide 473 of exon 4, ensuring iCre is expressed from the endogenous promoter/enhancer elements of *Nr5a1*.
- The pups will be genotyped by PCR analysis.
- In this study, the transgenic vector was constructed in vitro, and transgenic fragments containing *Nr5a1-iCre-polyA* were micro-injected into the fertilized eggs of C57BL/6JGpt mice, and pcr-positive F0 generation (i.e., founder) mice were obtained.

# Notice

- Other genes on the BAC are also expressed together.
- The BAC plasmid is large, and the BAC backbone may affect the expression of the gene of interest.
- Transgenic fragments injected into the prokaryotes will be randomly integrated into the mouse genome. Affected by the insertion site and copy number of transgenic fragments, the expression level of transgenic mice may be different.
- The scheme is designed according to the genetic information in the existing database. Due to the complex process of gene transcription and translation, it cannot be predicted completely at the present technology level.
