

Tnfsf9 Cas9-CKO Strategy

Designer:

Huan Wang

Design Date:

2019-8-8

Project Overview

Project Name

Tnfsf9

Project type

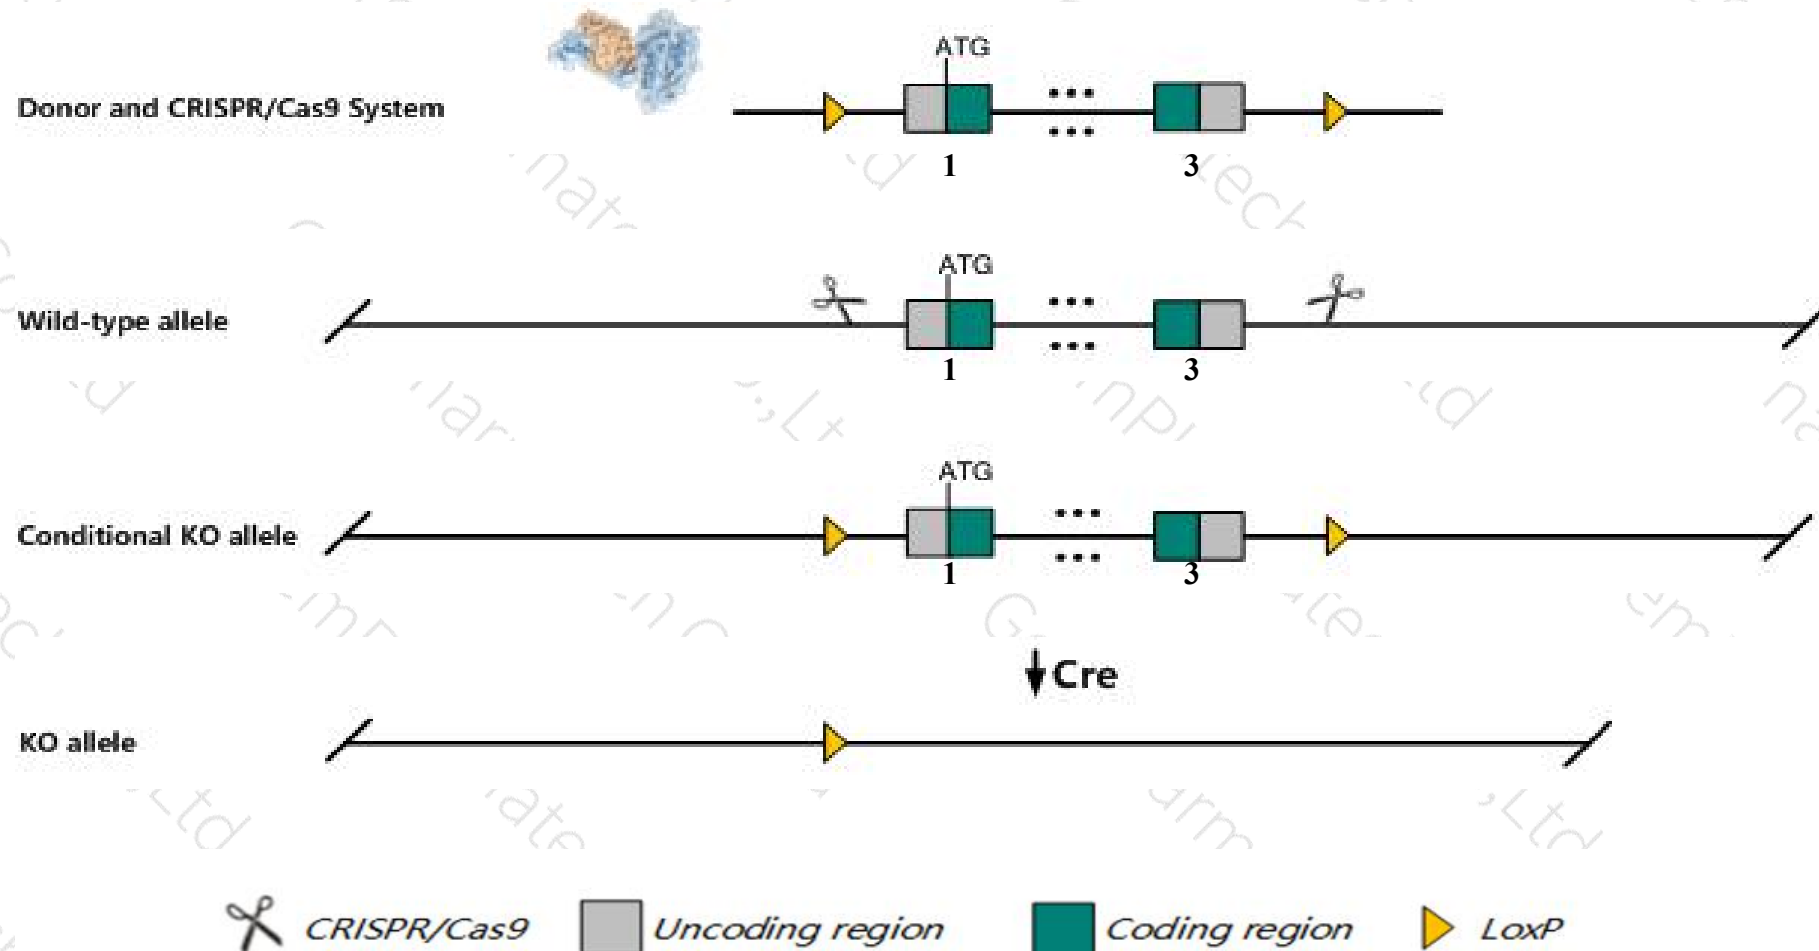

Cas9-CKO

Strain background

C57BL/6JGpt

Conditional Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Tnfsf9* gene. The schematic diagram is as follows:

- The *Tnfsf9* gene has 1 transcript. According to the structure of *Tnfsf9* gene, exon1-exon3 of *Tnfsf9-201* (ENSMUST00000039490.8) transcript is recommended as the knockout region. The region contains all of the coding sequence. Knock out the region will result in disruption of protein function.
- In this project we use CRISPR/Cas9 technology to modify *Tnfsf9* gene. The brief process is as follows: CRISPR/Cas9 system and Donor were microinjected into the fertilized eggs of C57BL/6JGpt mice. Fertilized eggs were transplanted to obtain positive F0 mice which were confirmed by PCR and sequencing. A stable F1 generation mouse model was obtained by mating positive F0 generation mice with C57BL/6JGpt mice.
- The flox mice will be knocked out after mating with mice expressing Cre recombinase, resulting in the loss of function of the target gene in specific tissues and cell types.

- According to the existing MGI data, Mice homozygous for a null allele exhibit increased susceptibility to viral infection and defective memory T cell activation.
- The KO region contains functional region of the *Gm11110* gene. Knockout the region may affect the function of *Gm11110* gene.
- The *Tnfsf9* gene is located on the Chr17. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This Strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of loxp insertion on gene transcription, RNA splicing and protein translation cannot be predicted at existing technological level.

Gene information (NCBI)

Tnfsf9 tumor necrosis factor (ligand) superfamily, member 9 [Mus musculus (house mouse)]

Gene ID: 21950, updated on 31-Jan-2019

Summary

Official Symbol	Tnfsf9 provided by MGI
Official Full Name	tumor necrosis factor (ligand) superfamily, member 9 provided by MGI
Primary source	MGI:MGI:1101058
See related	Ensembl:ENSMUSG00000035678
Gene type	protein coding
RefSeq status	PROVISIONAL
Organism	Mus musculus
Lineage	Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Euarchontoglires; Glires; Rodentia; Myomorpha; Muroidea; Muridae; Murinae; Mus; Mus
Also known as	4-1BB-L, 4-1BBL, AI848817, Cd137l, Ly63l
Expression	Ubiquitous expression in thymus adult (RPKM 3.6), limb E14.5 (RPKM 3.5) and 26 other tissues See more
Orthologs	human all

Transcript information (Ensembl)

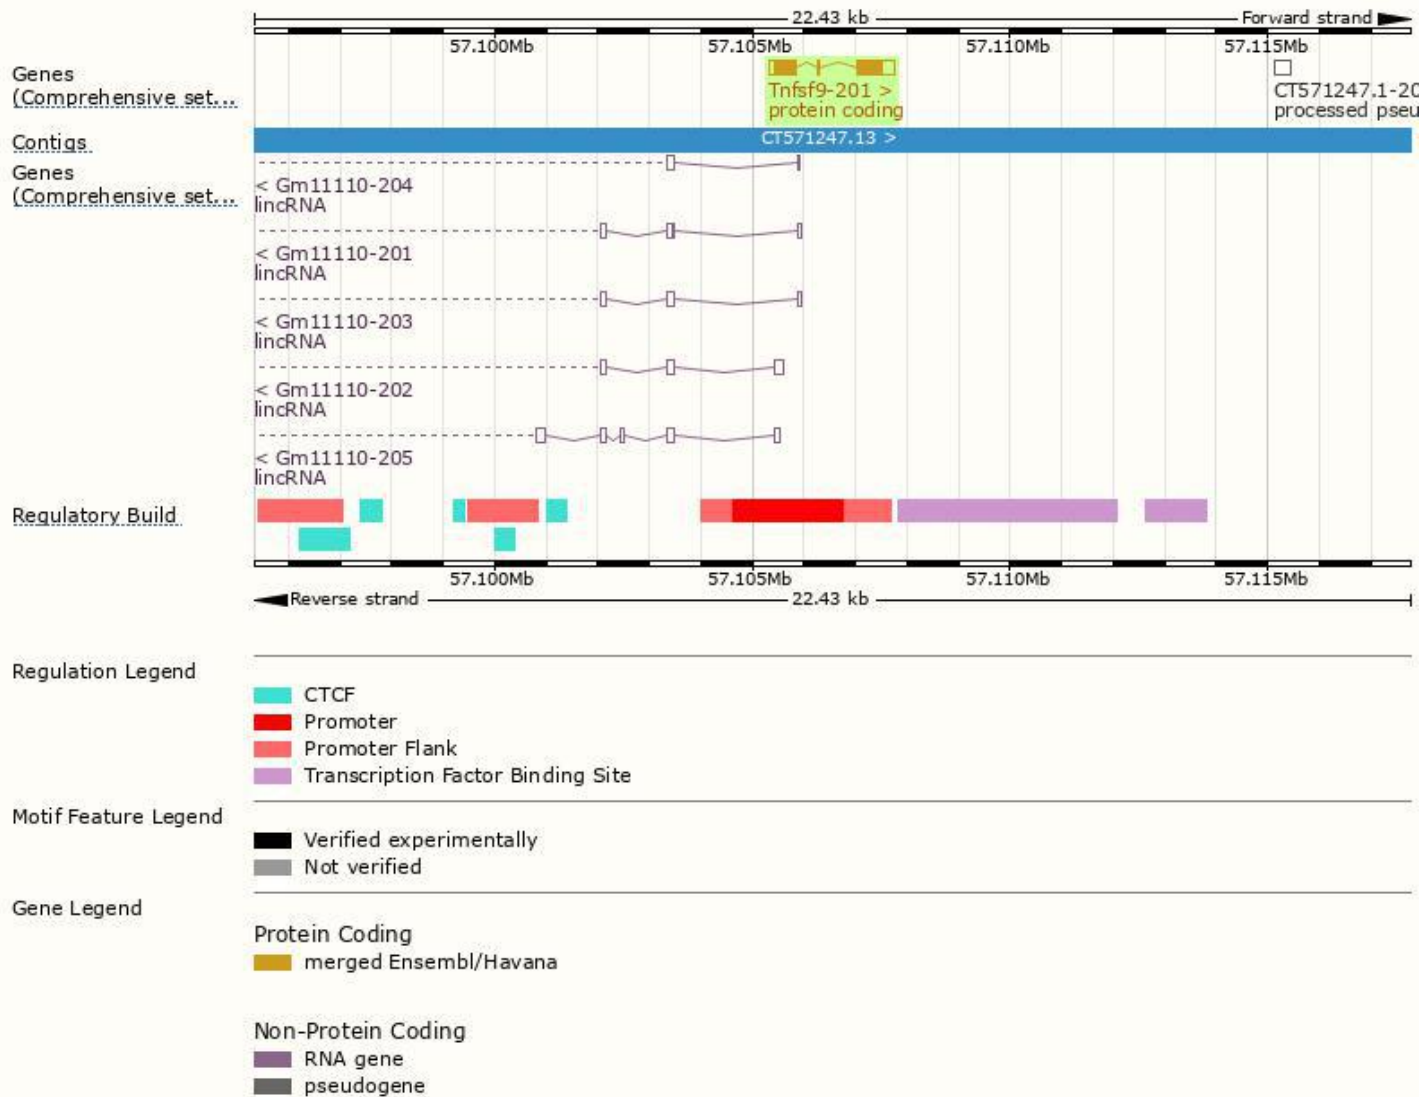

The gene has 1 transcript, and the transcript is shown below:

Name	Transcript ID	bp	Protein	Biotype	CCDS	UniProt	Flags
Tnfsf9-201	ENSMUST00000039490.8	1290	309aa	Protein coding	CCDS28926	P41274 Q3U1Z9	TSL:1 Gencode basic APPRIS P1

The strategy is based on the design of *Tnfsf9-201* transcript, The transcription is shown below

Genomic location distribution

Protein domain

Mouse phenotype description(MGI)

Phenotypes affected by the gene are marked in blue. Data quoted from MGI database(<http://www.informatics.jax.org/>).

According to the existing MGI data, Mice homozygous for a null allele exhibit increased susceptibility to viral infection and defective memory T cell activation.
