Spink4 Cas9-KO Strategy

Designer: Shilei Zhu

Design Date: 2019-7-22

Project Overview

Project Name Spink4

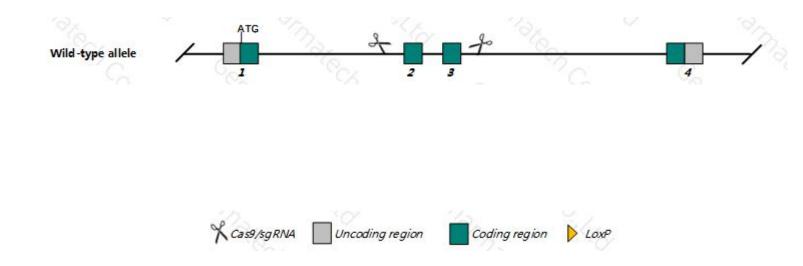

Project type Cas9-KO

Strain background C57BL/6JGpt

Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Spink4* gene. The schematic diagram is as follows:

Technical routes

- The *Spink4* gene has 2 transcript. According to the structure of *Spink4* gene, exon2-3 of *Spink4*-201 (ENSMUST00000030122.4) transcript is recommended as the knockout region. The region contains 154bp coding sequence. Knock out the region will result in disruption of protein function.
- ➤ In this project we use CRISPR/Cas9 technology to modify *Spink4* gene. The brief process is as follows: gRNA was transcribed in vitro, donor was constructed.Cas9, gRNA and Donor were microinjected into the fertilized eggs of C57BL/6JGpt mice.Fertilized eggs were transplanted to obtain positive F0 mice which were confirmed by PCR and sequencing. A stable F1 generation mouse model was obtained by mating positive F0 generation mice with C57BL/6JGpt mice.

Notice

- The *Spink4* gene is located on the Chr4. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- ➤ This Strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of the loxp insertion on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.
