

Aqp4 Cas9-KO Strategy

Designer:

Huan Fan

Design Date:

2019-8-23

Project Overview

Project Name

Aqp4

Project type

Cas9-KO

Strain background

C57BL/6JGpt

Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Aqp4* gene. The schematic diagram is as follows:

- The *Aqp4* gene has 11 transcripts. According to the structure of *Aqp4* gene, exon2 of *Aqp4-201* (ENSMUST00000079081.7) transcript is recommended as the knockout region. The region contains 415bp coding sequence. Knock out the region will result in disruption of protein function.
- In this project we use CRISPR/Cas9 technology to modify *Aqp4* gene. The brief process is as follows: CRISPR/Cas9 system v

- According to the existing MGI data, Homozygotes for a targeted mutation exhibit decreased urine osmolality associated with reduced water permeability in inner medullary collecting ducts, increased survival rates and reduced brain edema after acute water intoxication and ischemic stroke, as well as significant hearing impairment.
- The *Aqp4* gene is located on the Chr18. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This Strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of the gene knockout on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.

Gene information (NCBI)

Aqp4 aquaporin 4 [Mus musculus (house mouse)]

Gene ID: 11829, updated on 9-Apr-2019

Summary

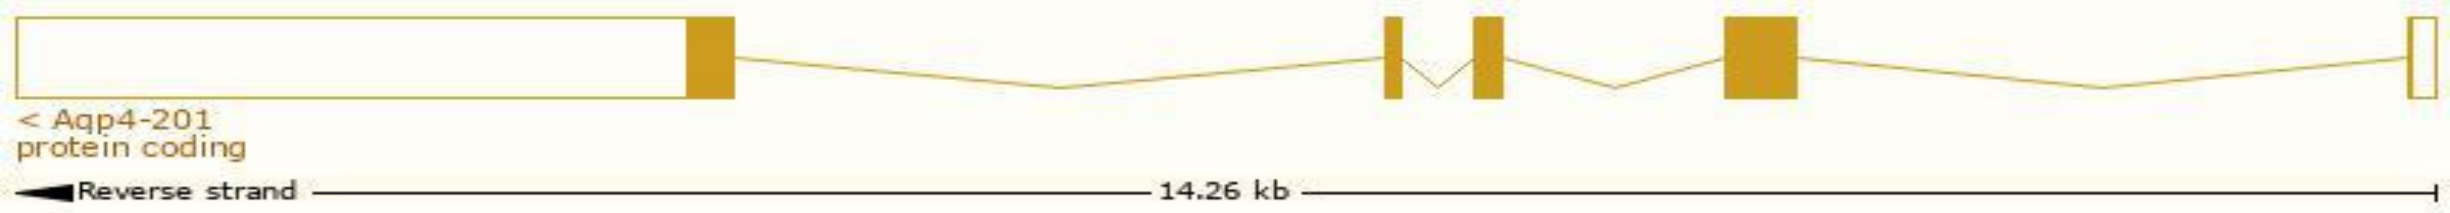

Official Symbol	Aqp4 provided by MGI
Official Full Name	aquaporin 4 provided by MGI
Primary source	MGI:MGI:107387
See related	Ensembl:ENSMUSG00000024411
Gene type	protein coding
RefSeq status	REVIEWED
Organism	Mus musculus
Lineage	Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Euarchontoglires; Glires; Rodentia; Myomorpha; Muroidea; Muridae; Murinae; Mus; Mus
Also known as	WCH4
Summary	This gene encodes a member of the aquaporin family of intrinsic membrane proteins that function as water-selective channels in the plasma membranes of many cells. This protein is the predominant aquaporin found in brain and has an important role in brain water homeostasis. Alternatively spliced transcript variants encoding different isoforms have been described for this gene. A recent study provided evidence for translational readthrough in this gene and expression of an additional C-terminally extended isoform via the use of an alternative in-frame translation termination codon. [provided by RefSeq, Dec 2015]
Expression	Biased expression in cerebellum adult (RPKM 26.4), frontal lobe adult (RPKM 12.8) and 4 other tissues See more
Orthologs	human all

Transcript information (Ensembl)

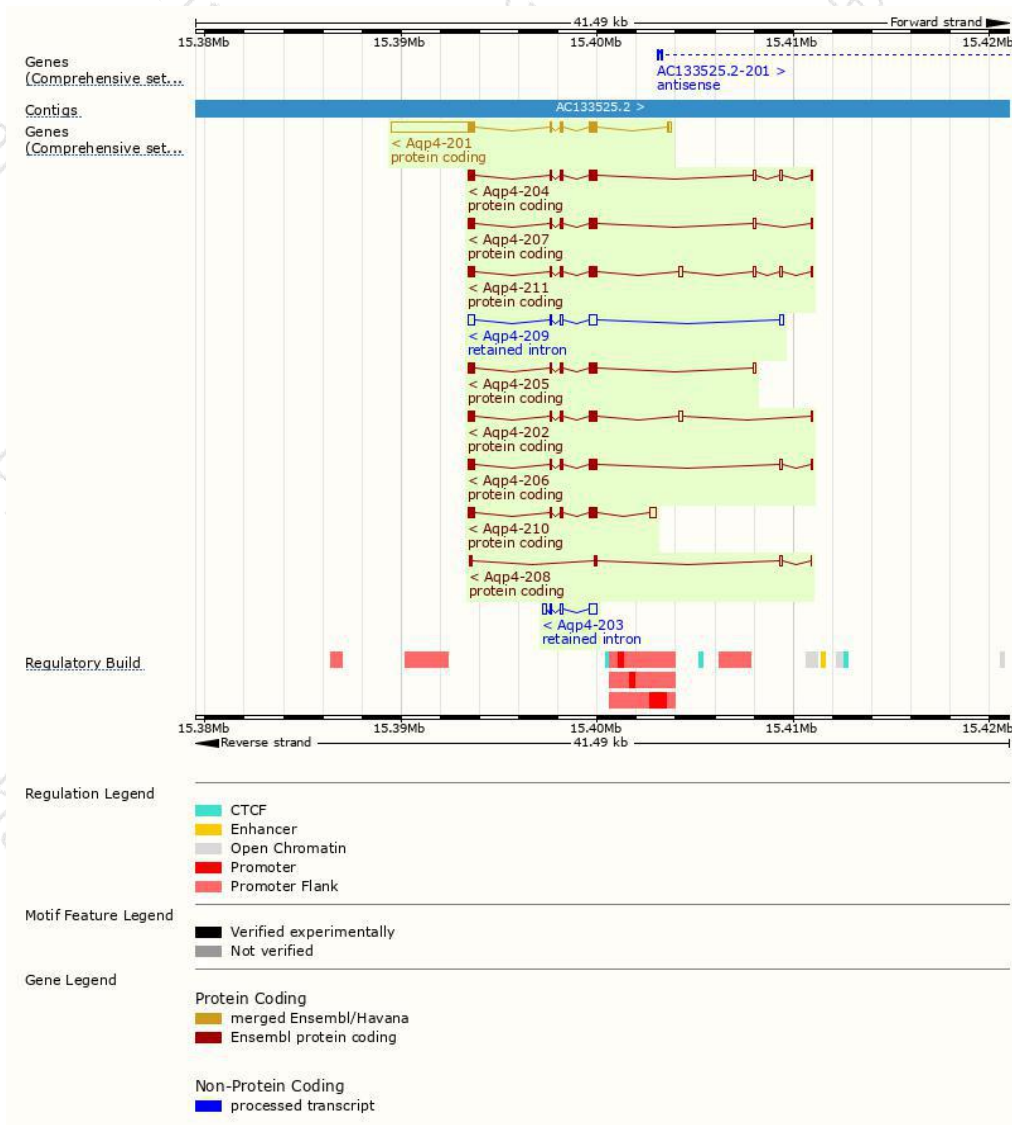

The gene has 11 transcripts,all transcripts are shown below:

Name	Transcript ID	bp	Protein	Biotype	CCDS	UniProt	Flags
Aqp4-201	ENSMUST00000079081.7	5054	323aa	Protein coding	CCDS29073	A0A0R4J0Z3	TSL:1 GENCODE basic APPRIS P2

Aqp4-208	ENSMUST00000234533.1	453	83aa	Protein coding	-	-	CDS 3' incomplete
Aqp4-209	ENSMUST00000234624.1	1218	No protein	Retained intron	-	-	
Aqp4-203	ENSMUST00000234140.1	902	No protein	Retained intron	-	-	

The strategy is based on the design of *Aqp4-201* transcript,The transcription is shown below

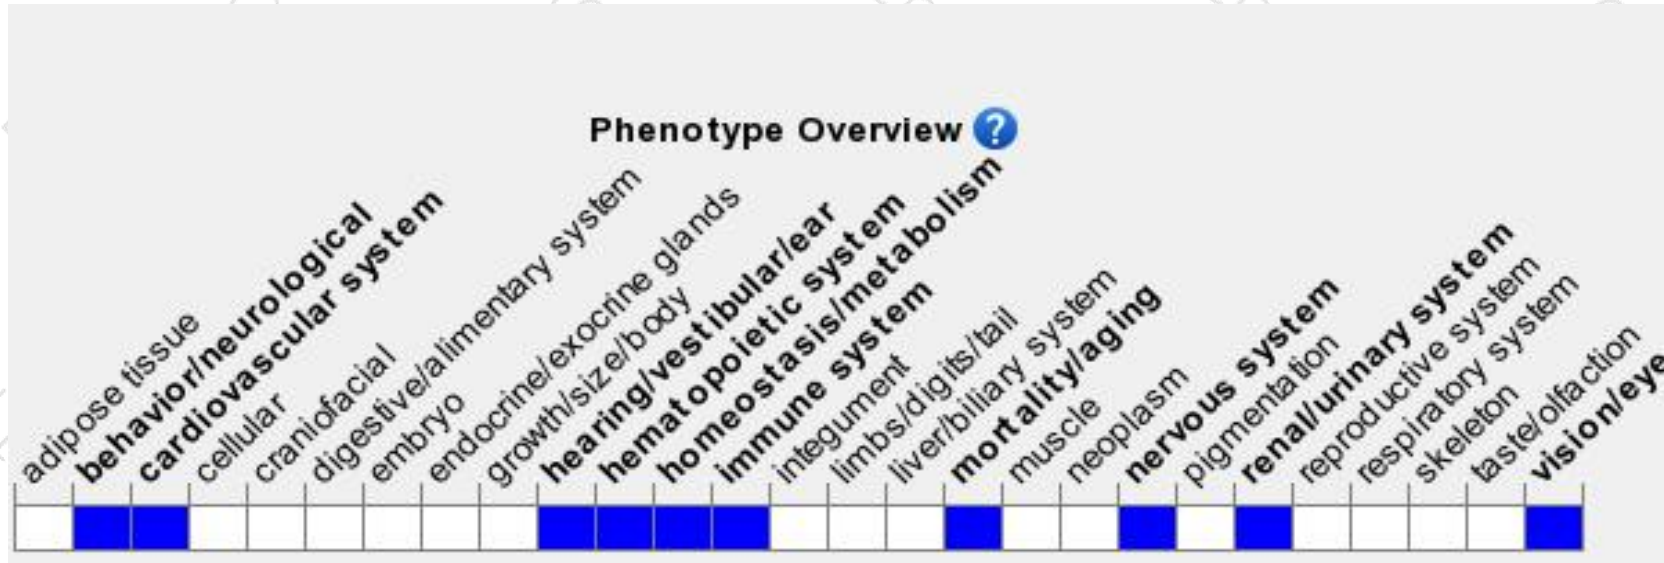

Genomic location distribution

Protein domain

Mouse phenotype description(MGI)

Phenotypes affected by the gene are marked in blue. Data quoted from MGI database(<http://www.informatics.jax.org/>).

According to the existing MGI data, Homozygotes for a targeted mutation exhibit decreased urine osmolality associated with reduced water permeability in inner medullary collecting ducts, increased survival rates and reduced brain edema after acute water intoxication and ischemic stroke, as well as significant hearing impairment.
