# Conditional Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Mbnl3* gene. The schematic diagram is as follows:

# Technical routes

- The *Mbnl3* gene has 7 transcripts. According to the structure of *Mbnl3* gene, exon3-exon6 of *Mbnl3*-203 (ENSMUST00000114876.8) transcript is recommended as the knockout region. The region contains 745bp coding sequence. Knock out the region will result in disruption of protein function.
- In this project we use CRISPR/Cas9 technology to modify *Mbnl3* gene. The brief process is as follows: CRISPR/Cas9 system and Donor were microinjected into the fertilized eggs of C57BL/6JGpt mice. Fertilized eggs were transplanted to obtain positive F0 mice which were confirmed by PCR and sequencing. A stable F1 generation mouse model was obtained by mating positive F0 generation mice with C57BL/6JGpt mice.
- The flox mice will be knocked out after mating with mice expressing Cre recombinase, resulting in the loss of function of the target gene in specific tissues and cell types.

- According to the existing MGI data, Mice homozygous for an allele lacking exon 2 exhibit impaired muscle regeneration.
- The *Mbnl3* gene is located on the ChrX. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This Strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of loxp insertion on gene transcription, RNA splicing and protein translation cannot be predicted at existing technological level.
