Project Overview

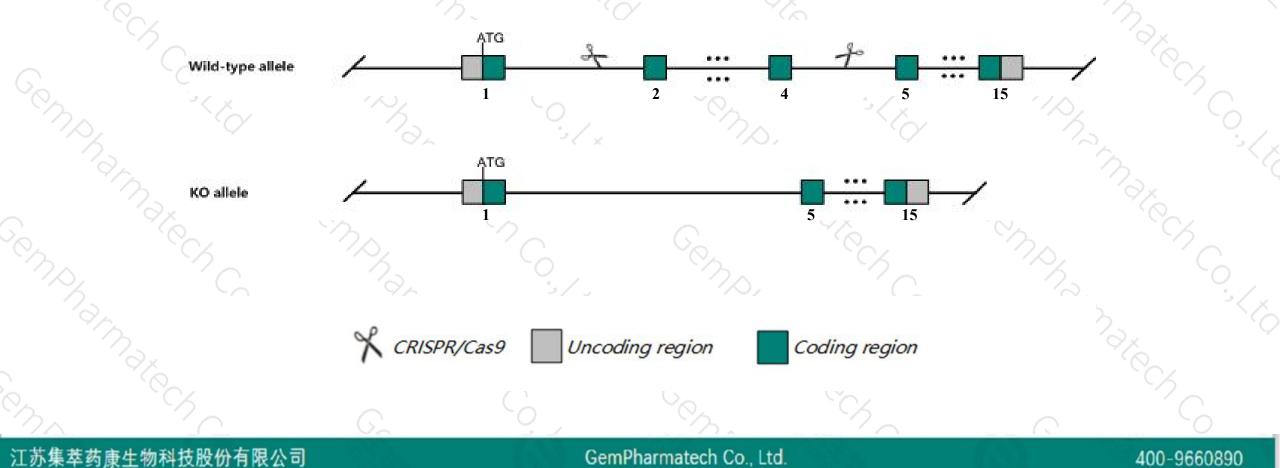

Knockout strategy

This model will use CRISPR/Cas9 technology to edit the Kat7 gene. The schematic diagram is as follows:

- The Kat7 gene has 11 transcripts. According to the structure of Kat7 gene, exon2-exon4 of Kat7-205 (ENSMUST00000107734.9) transcript is recommended as the knockout region. The region contains 565bp coding sequence. Knock out the region will result in disruption of protein function.
- > In this project we use CRISPR/Cas9 technology to modify Kat7 gene. The brief process is as follows: CRISPR/Cas9 system v

- According to the existing MGI data, Mice homozygous for a knock-out allele exhibit embryonic growth arrest, incomplete embryo turning, disorganized yolk sac vascular plexus, and increased apoptosis.
- The Kat7 gene is located on the Chr11. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This Strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of the gene knockout on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.
