Project Overview

Project Name**Gpat3**

Project type**Cas9-KO**

Strain background**C57BL/6JGpt**

Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Gpat3* gene. The schematic diagram is as follows:

Technical routes

- The *Gpat3* gene has 5 transcripts. According to the structure of *Gpat3* gene, exon4 of *Gpat3-203* (ENSMUST00000112887.7) transcript is recommended as the knockout region. The region contains 67bp coding sequence. Knock out the region will result in disruption of protein function.
- In this project we use CRISPR/Cas9 technology to modify *Gpat3* gene. The brief process is as follows: CRISPR/Cas9 system

Notice

- According to the existing MGI data, Under high-fat feeding, mice homozygous for a knock-out allele exhibit increased energy expenditure, improved glucose homeostasis, enlarged livers, increased total serum cholesterol levels, altered liver cholesterol metabolism, and female-specific protection from diet-induced obesity.
- The transcripts 204, 205 are incomplete and the effects are unknown.
- The *Gpat3* gene is located on the Chr5. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This Strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of the gene knockout on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.
