Project Overview

Project Name

Tnnc1

Project type

Cas9-KO

Strain background

C57BL/6JGpt

Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Tnnc1* gene. The schematic diagram is as follows:

- The *Tnnc1* gene has 3 transcripts. According to the structure of *Tnnc1* gene, exon2-6 of *Tnnc1*-202 (ENSMUST00000169169.7) transcript is recommended as the knockout region. The region contains most of coding sequence. Knock out the region will result in disruption of protein function.
- In this project we use CRISPR/Cas9 technology to modify *Tnnc1* gene. The brief process is as follows: gRNA was transcribed in vitro. Cas9 and gRNA were microinjected into the fertilized eggs of C57BL/6JGpt mice. Fertilized eggs were transplanted to obtain positive F0 mice which were confirmed by PCR and sequencing. A stable F1 generation mouse model was obtained by mating positive F0 generation mice with C57BL/6JGpt mice.

- *Tnncl* is located in intron of *Nisch* gene, the partial sequence of intron of *Nisch* gene will be deleted together in this strategy.
- The knockout region is near to the N-terminal of *Nisch* gene and *Sema3g* gene, this strategy may influence the regulatory function of the N-terminal of these genes.
- The *Tnncl* gene is located on the Chr6. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This Strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of the gene knockout on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.

Gene information (NCBI)

Tnnc1 troponin C, cardiac/slow skeletal [*Mus musculus* (house mouse)]

Gene ID: 21924, updated on 12-Aug-2019

Summary

Official Symbol Tnnc1 provided by [MGI](#)
Official Full Name troponin C, cardiac/slow skeletal provided by [MGI](#)
Primary source [MGI:MGI:98779](#)
