

Slc34a3 Cas9-KO Strategy

Designer: Reviewer: Design Date: JiaYu Xiaojing Li 2020-1-20

Project Overview

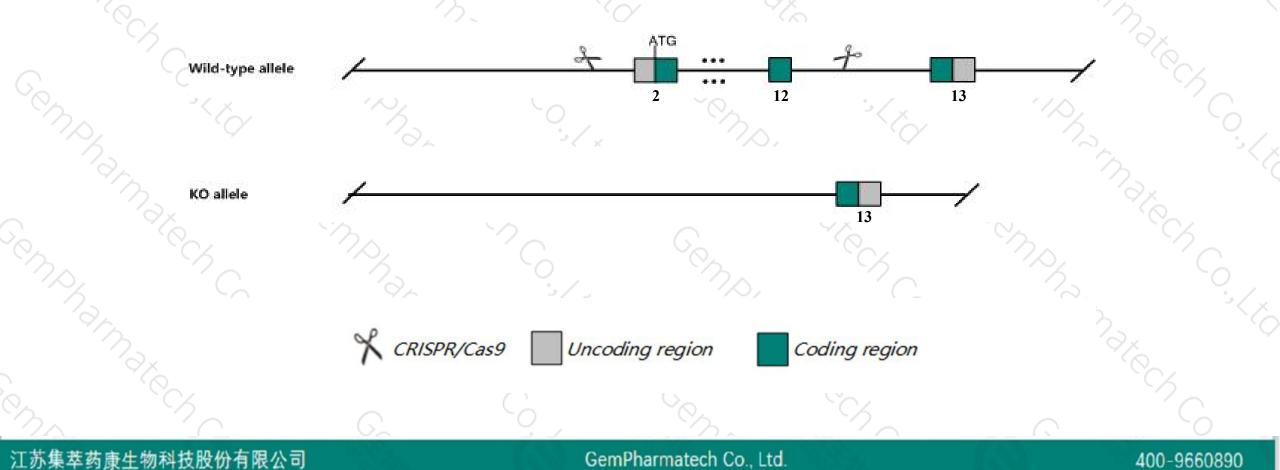

Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Slc34a3* gene. The schematic diagram is as follows:

- The Slc34a3 gene has 7 transcripts. According to the structure of Slc34a3 gene, exon2-exon12 of Slc34a3-201 (ENSMUST0000006638.7) transcript is recommended as the knockout region. The region contains start codon ATG. Knock out the region will result in disruption of protein function.
- > In this project we use CRISPR/Cas9 technology to modify Slc34a3 gene. The brief process is as follows: CRISPR/Cas9 syste

400-9660890

- According to the existing MGI data, Mice homozygous for a knock-out allele exhibit hypercalciuria, hypercalcemia and increased plasma 1,25(OH)2D3 levels but do not develop hypophosphatemia, renal calcification, rickets, or osteomalacia.
- The Slc34a3 gene is located on the Chr2. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This Strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of the gene knockout on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.

Mouse phenotype description(MGI)

Phenotypes affected by the gene are marked in blue. Data quoted from MGI database(http://www.informatics.jax.org/).

According to the existing MGI data, Mice homozygous for a knock-out allele exhibit hypercalciuria, hypercalcemia and increased plasma 1,25(OH)2D3 levels but do not develop hypophosphatemia, renal calcification, rickets, or osteomalacia.
