Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Rab5b* gene. The schematic diagram is as follows:

- The *Rab5b* gene has 2 transcripts. According to the structure of *Rab5b* gene, exon3-exon4 of *Rab5b-201* (ENSMUST00000000727.3) transcript is recommended as the knockout region. The region contains 275bp coding sequence. Knock out the region will result in disruption of protein function.
- In this project we use CRISPR/Cas9 technology to modify *Rab5b* gene. The brief process is as follows: CRISPR/Cas9 system

- The *Rab5b* gene is located on the Chr10. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of the gene knockout on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.
