### **Project Overview**

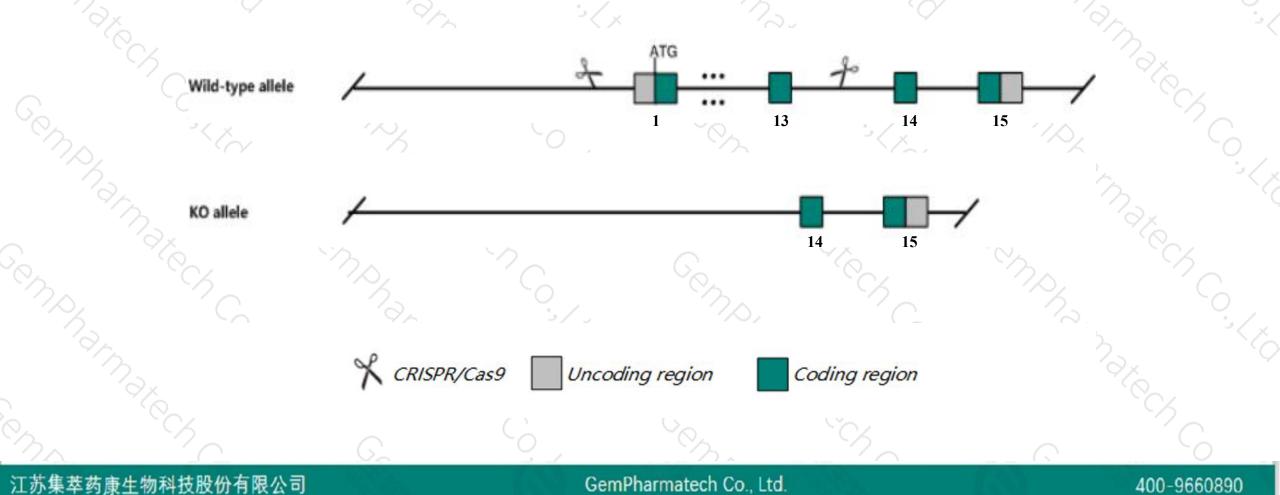

# **Knockout strategy**

This model will use CRISPR/Cas9 technology to edit the Dnpep gene. The schematic diagram is as follows:

The Dnpep gene has 14 transcripts. According to the structure of Dnpep gene, exon1-exon13 of Dnpep-204 (ENSMUST00000185797.6) transcript is recommended as the knockout region. The region contains start codon ATG. Knock out the region will result in disruption of protein function.

> In this project we use CRISPR/Cas9 technology to modify Dnpep gene. The brief process is as follows: CRISPR/Cas9 system

- The Dnpep gene is located on the Chr1. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This Strategy is designed based on genetic information in existing databases.Due to the complexity of biological processes, all risk of the gene knockout on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.
