# **Project Overview**

**Project Name** 

Zbtb10

**Project type** 

Cas9-KO

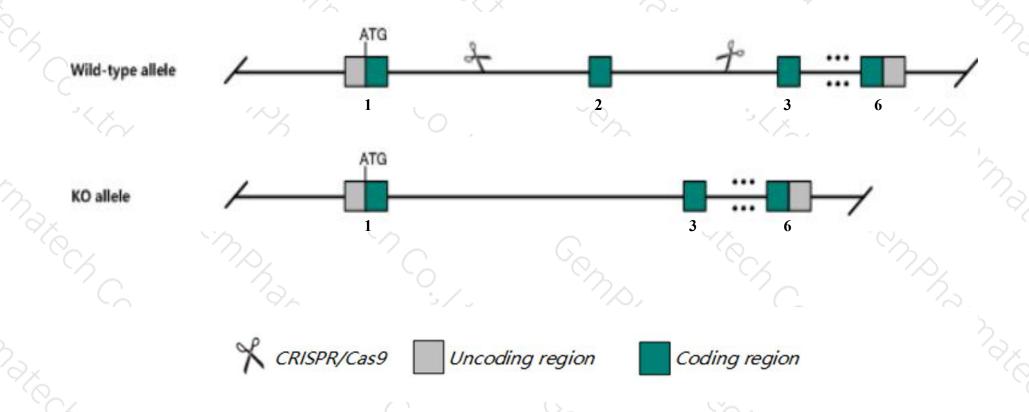

Strain background

C57BL/6JGpt

# **Knockout strategy**

This model will use CRISPR/Cas9 technology to edit the Zbtb10 gene. The schematic diagram is as follows:

### **Technical routes**

- ➤ The Zbtb10 gene has 1 transcript. According to the structure of Zbtb10 gene, exon2 of Zbtb10-201(ENSMUST00000155203.1) transcript is recommended as the knockout region. The region contains 886bp coding sequence. Knock out the region will result in disruption of protein function.
- ➤ In this project we use CRISPR/Cas9 technology to modify *Zbtb10* gene. The brief process is as follows: CRISPR/Cas9 system were microinjected into the fertilized eggs of C57BL/6JGpt mice. Fertilized eggs were transplanted to obtain positive F0 mice which were confirmed by PCR and sequencing. A stable F1 generation mouse model was obtained by mating positive F0 generation mice with C57BL/6JGpt mice.

### **Notice**

- > The Zbtb10 gene is located on the Chr3. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- ➤ Some amino acids will remain at the N-terminus and some functions may be retained.
- > This strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of the gene knockout on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.
