Project Overview

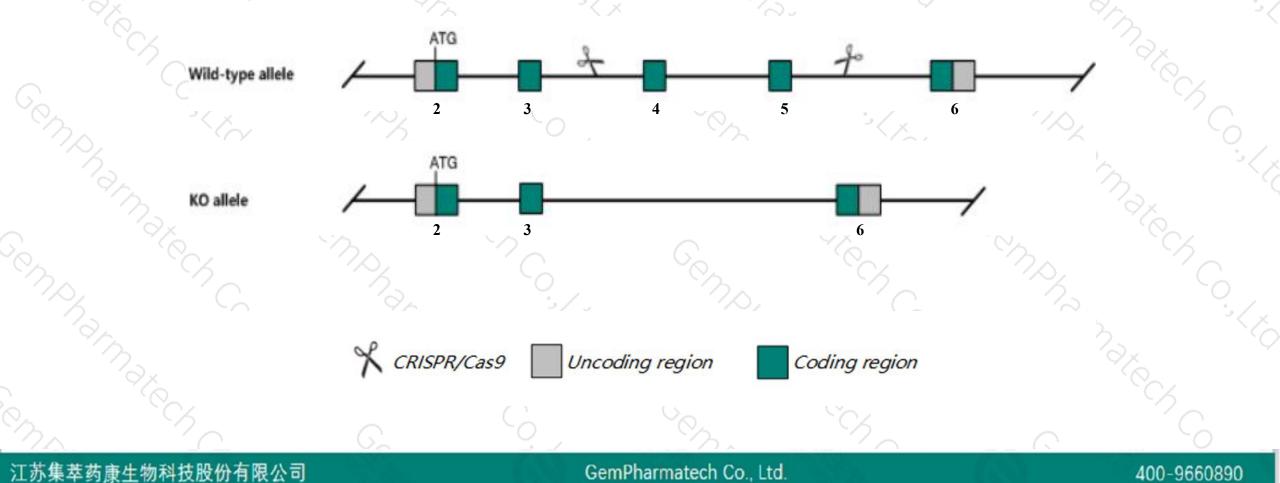

Knockout strategy

This model will use CRISPR/Cas9 technology to edit the Zfp286 gene. The schematic diagram is as follows:

> The *Zfp286* gene has 11 transcripts. According to the structure of *Zfp286* gene, exon4-exon5 of *Zfp286*-201(ENSMUST00000054654.12) transcript is recommended as the knockout region. The region contains 205bp coding sequence. Knock out the region will result in disruption of protein function.

> In this project we use CRISPR/Cas9 technology to modify *Zfp286* gene. The brief process is as follows: CRISPR/Cas9 system were microinjected into the fertilized eggs of C57BL/6JGpt mice.Fertilized eggs were transplanted to obtain positive F0 mice which were confirmed by PCR and sequencing. A stable F1 generation mouse model was obtained by mating positive F0 generation mice with C57BL/6JGpt mice.

> The *Zfp286* gene is located on the Chr11. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.

➤ Transcript Zfp286-203&207&210 may not be affected.

➤ This strategy is designed based on genetic information in existing databases.Due to the complexity of biological processes,all risk of the gene knockout on gene transcription, RNA splicing and protein translation cannot be predicted at the existing technology level.
