

Hnrnpk Cas9-CKO Strategy

Designer: Huan Wang

Reviewer: Yumeng Wang

Design Date: 2021-9-27

Project Overview

Project Name

Hnrnpk

Project type

Cas9-CKO

Strain background

C57BL/6JGpt

Conditional Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Hnrnpk* gene. The schematic diagram is as follows:

- The *Hnrnpk* gene has 34 transcripts. According to the structure of *Hnrnpk* gene, exon5-exon8 of *Hnrnpk*-202(ENSMUST00000116403.9) transcript is recommended as the knockout region. The region contains 272bp coding sequence. Knock out the region will result in disruption of protein function.
- In this project we use CRISPR/Cas9 technology to modify *Hnrnpk* gene. The brief process is as follows: CRISPR/Cas9 system and Donor were microinjected into the fertilized eggs of C57BL/6JGpt mice. Fertilized eggs were transplanted to obtain positive F0 mice which were confirmed by PCR and sequencing. A stable F1 generation mouse model was obtained by mating positive F0 generation mice with C57BL/6JGpt mice.
- The flox mice will be knocked out after mating with mice expressing Cre recombinase, resulting in the loss of function of the target gene in specific tissues and cell types.

- The Intron4 and Intron8 are only 342bp and 567bp, loxp insertion may affect mRNA splicing.
- The *Hnrnpk* gene is located on the Chr13. If the knockout mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This strategy is designed based on genetic information in existing databases. Due to the complexity of biological processes, all risk of loxp insertion on gene transcription, RNA splicing and protein translation cannot be predicted at existing technological level.

Gene information (NCBI)

Hnrnpk heterogeneous nuclear ribonucleoprotein K [Mus musculus (house mouse)]

Gene ID: 15387, updated on 13-Mar-2020

Summary

Official Symbol Hnrnpk provided by [MGI](#)

Official Full Name heterogeneous nuclear ribonucleoprotein K provided by [MGI](#)

Primary source [MGI:MGI:99894](#)

Gene type protein coding

RefSeq status REVIEWED

Organism [Mus musculus](#)

Lineage Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Euarchontoglires; Glires; Rodentia; Myomorpha; Muroidea; Muridae; Murinae; Mus; Mus

Also known as Hnrpk, KBBP, NOVA

Summary The protein encoded by this gene is a component of the heterogeneous nuclear ribonucleoprotein (hnRNP) complex, and is a poly-cytosine binding protein (PCBP). It is found in multiple subcellular compartments including the nucleus, cytoplasm and mitochondria. This gene product is thought to interact with RNA, DNA, and protein, and is involved in multiple cellular processes, including transcription, chromatin remodeling, DNA damage response, signal transduction, mRNA splicing, export, and translation. Multiple transcript variants and protein isoforms exist, with some isoforms containing a unique C-terminus. There are four pseudogenes of this gene, found on chromosomes 2, 3, 7 and 13. [provided by RefSeq, Aug 2014]

Expression Ubiquitous expression in CNS E11.5 (RPKM 240.5), CNS E14 (RPKM 167.5) and 25 other tissues [See more](#)

Orthologs [human](#) [all](#)

Transcript information (Ensembl)

The gene has 34 transcripts,all transcripts are shown below:

Name	Transcript ID	bp	Protein	Biotype	CCDS	UniProt	Flags
Hnrnpk-202	ENSMUST00000116403.8	2970	464aa	Protein coding	CCDS79199	P61979_Q6FYWJ5	TSL-1 GENCODE basic APPRIS is a system to annotate alternatively spliced transcripts based on a range of computational methods to identify the most functionally important transcript(s) of a gene. APPRIS ALT1
