Project Overview

Project Name

Cd4-IRES-iCre

Project type

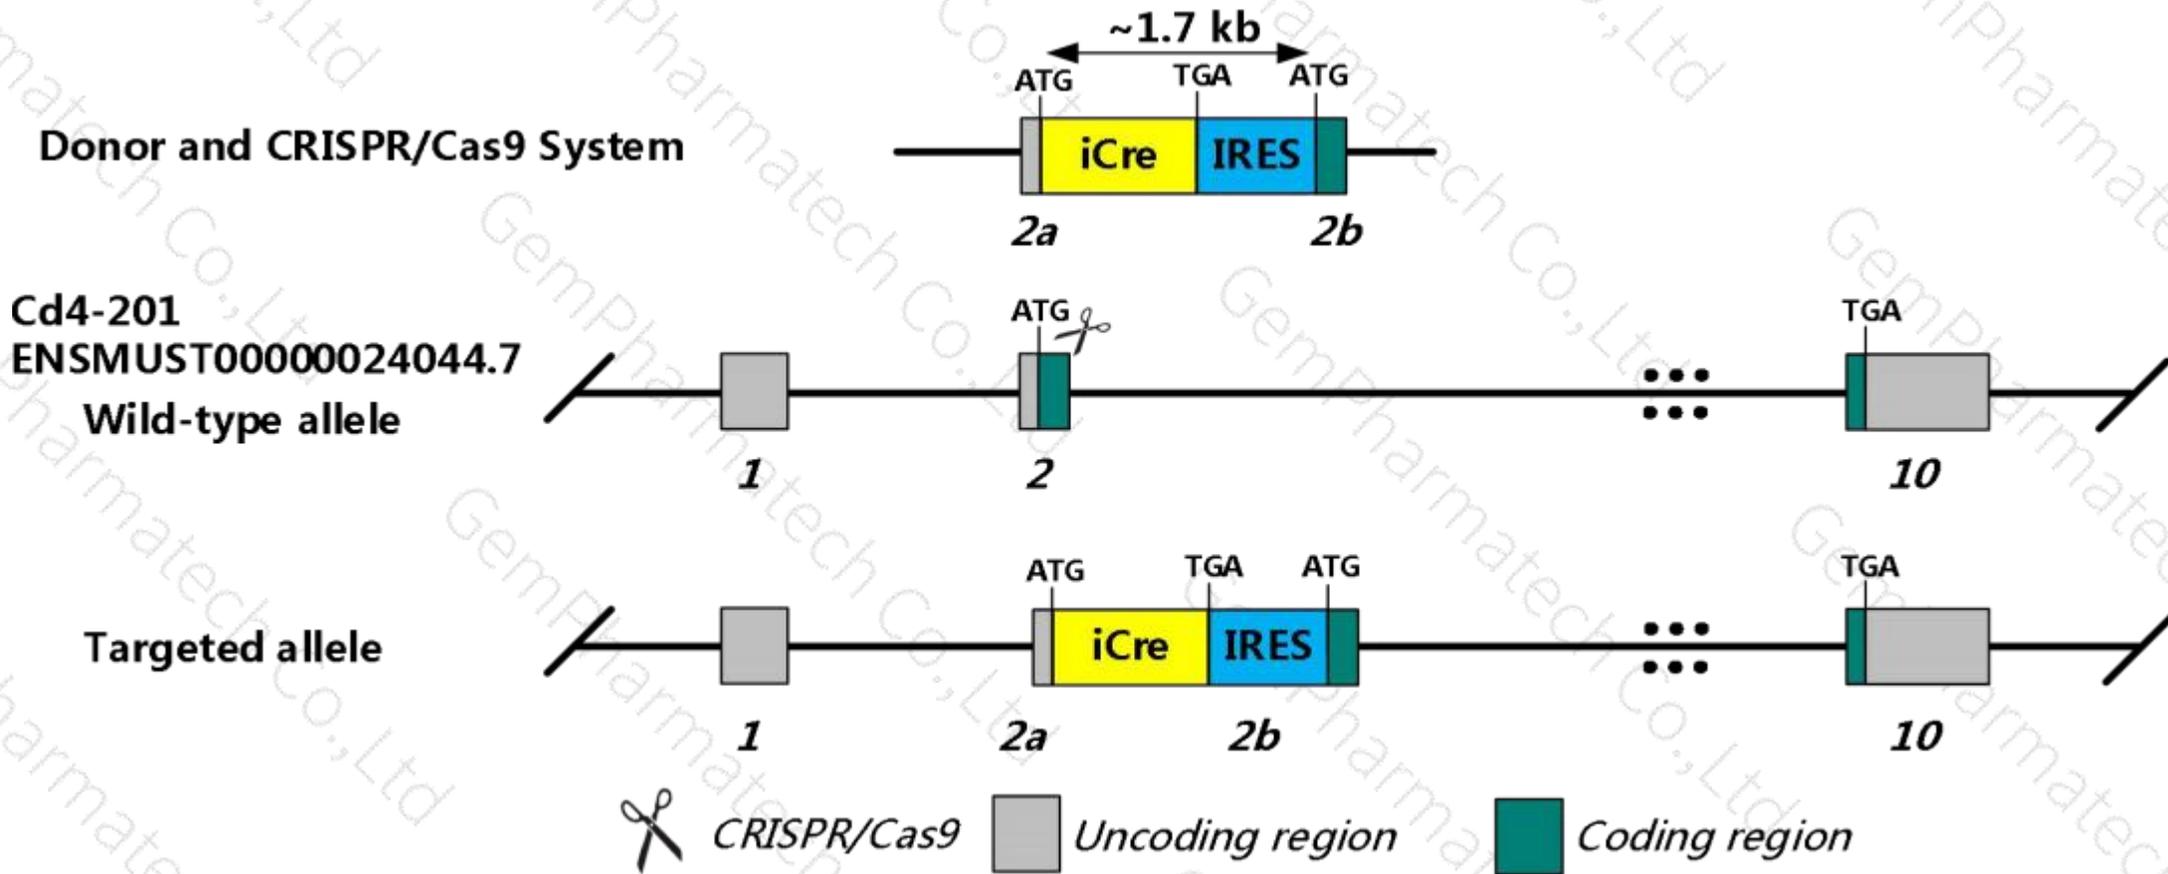

Cas9-KI

Strain background

C57BL/6JGpt

Knockin strategy

This model will use CRISPR/Cas9 technology to edit the *Cd4* gene. The schematic diagram is as follows:

Technical routes

- The mouse *Cd4* gene has 5 transcripts. According to the structure of *Cd4* gene, *Cd4-201* (ENSMUST00000024044.7) transcript is selected for this strategy. The transcript of *Cd4-201* contains 10 exons, codes 457aa, the ATG is located in exon2, and the TGA is located in exon10.
- We constructed CRISPR/Cas9 system targeting mouse *Cd4* gene and donor vector, iCre-IRES will be introduced to near the ATG of mouse *Cd4* gene. The iCre will be expressed under the direction of endogenous regulatory mechanism.
- The project will use CRISPR/Cas9 technology to modify *Cd4* gene. The brief process is as follows: CRISPR/Cas9 system and donor were microinjected into the fertilized eggs of C57BL/6JGpt mice. Fertilized eggs were transplanted to obtain positive F0 mice which were confirmed by PCR and sequencing. A stable F1 generation mouse model was obtained by mating positive F0 generation mice with C57BL/6JGpt mice.

- According to the existing MGI data, mice homozygous for knock-out alleles exhibit abnormal immune system morphology and physiology.
- The IRES-linked genes will be transcribed together and then be translated two protein separately, but the downstream protein is lower than the upstream protein.
- There may be 1 to 2 amino acid synonymous mutation in exon2 of *Cd4* gene in this strategy.
- After customer verification, mice homozygous for knock-in alleles appear the CD4-KO phenotype, the expression of heterozygous for knock-in alleles is halved, and the homozygous could not detect CD4⁺ cells.
- The *Cd4* gene is located on the Chr6. If the knockin mice are crossed with other mice strains to obtain double gene positive homozygous mouse offspring, please avoid the two genes on the same chromosome.
- This strategy is designed based on genetic information in existing databases. Due to the complexity of gene transcription and translation, it is impossible to predict all of them at the existing technology level.

Summary

Official Symbol Cd4 provided by MGI
Official Full Name CD4 antigen provided by MGI
Primary source MGI:MGI:88335
See related Ensembl:ENSMUSG00000023274
Gene type protein coding
RefSeq status VALIDATED
Organism *Mus musculus*
Lineage Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Euarchontoglires; Glires; Rodentia; Myomorpha; Muroidea; Muridae; Murinae; Mus; Mus
Also known as L3T; Ly-; L3T4; Ly-4
Expression Biased expression in thymus adult (RPKM 167.0), spleen adult (RPKM 15.0) and 1 other tissue [See more](#)
Orthologs [human](#) [all](#)

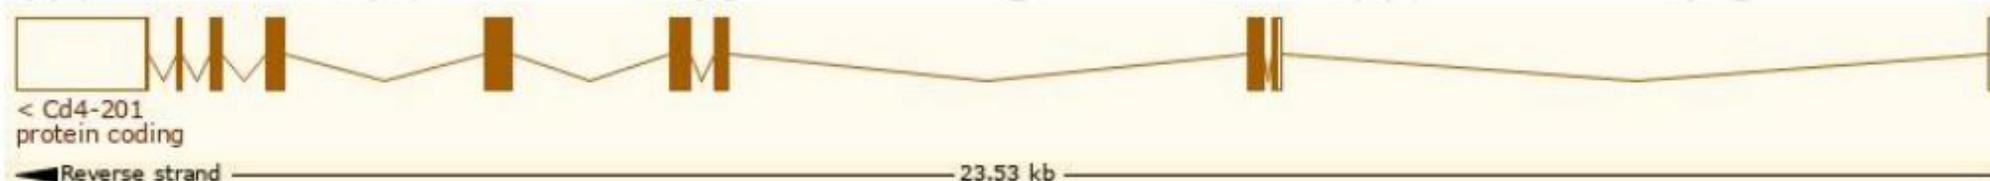

Transcript information (Ensembl)

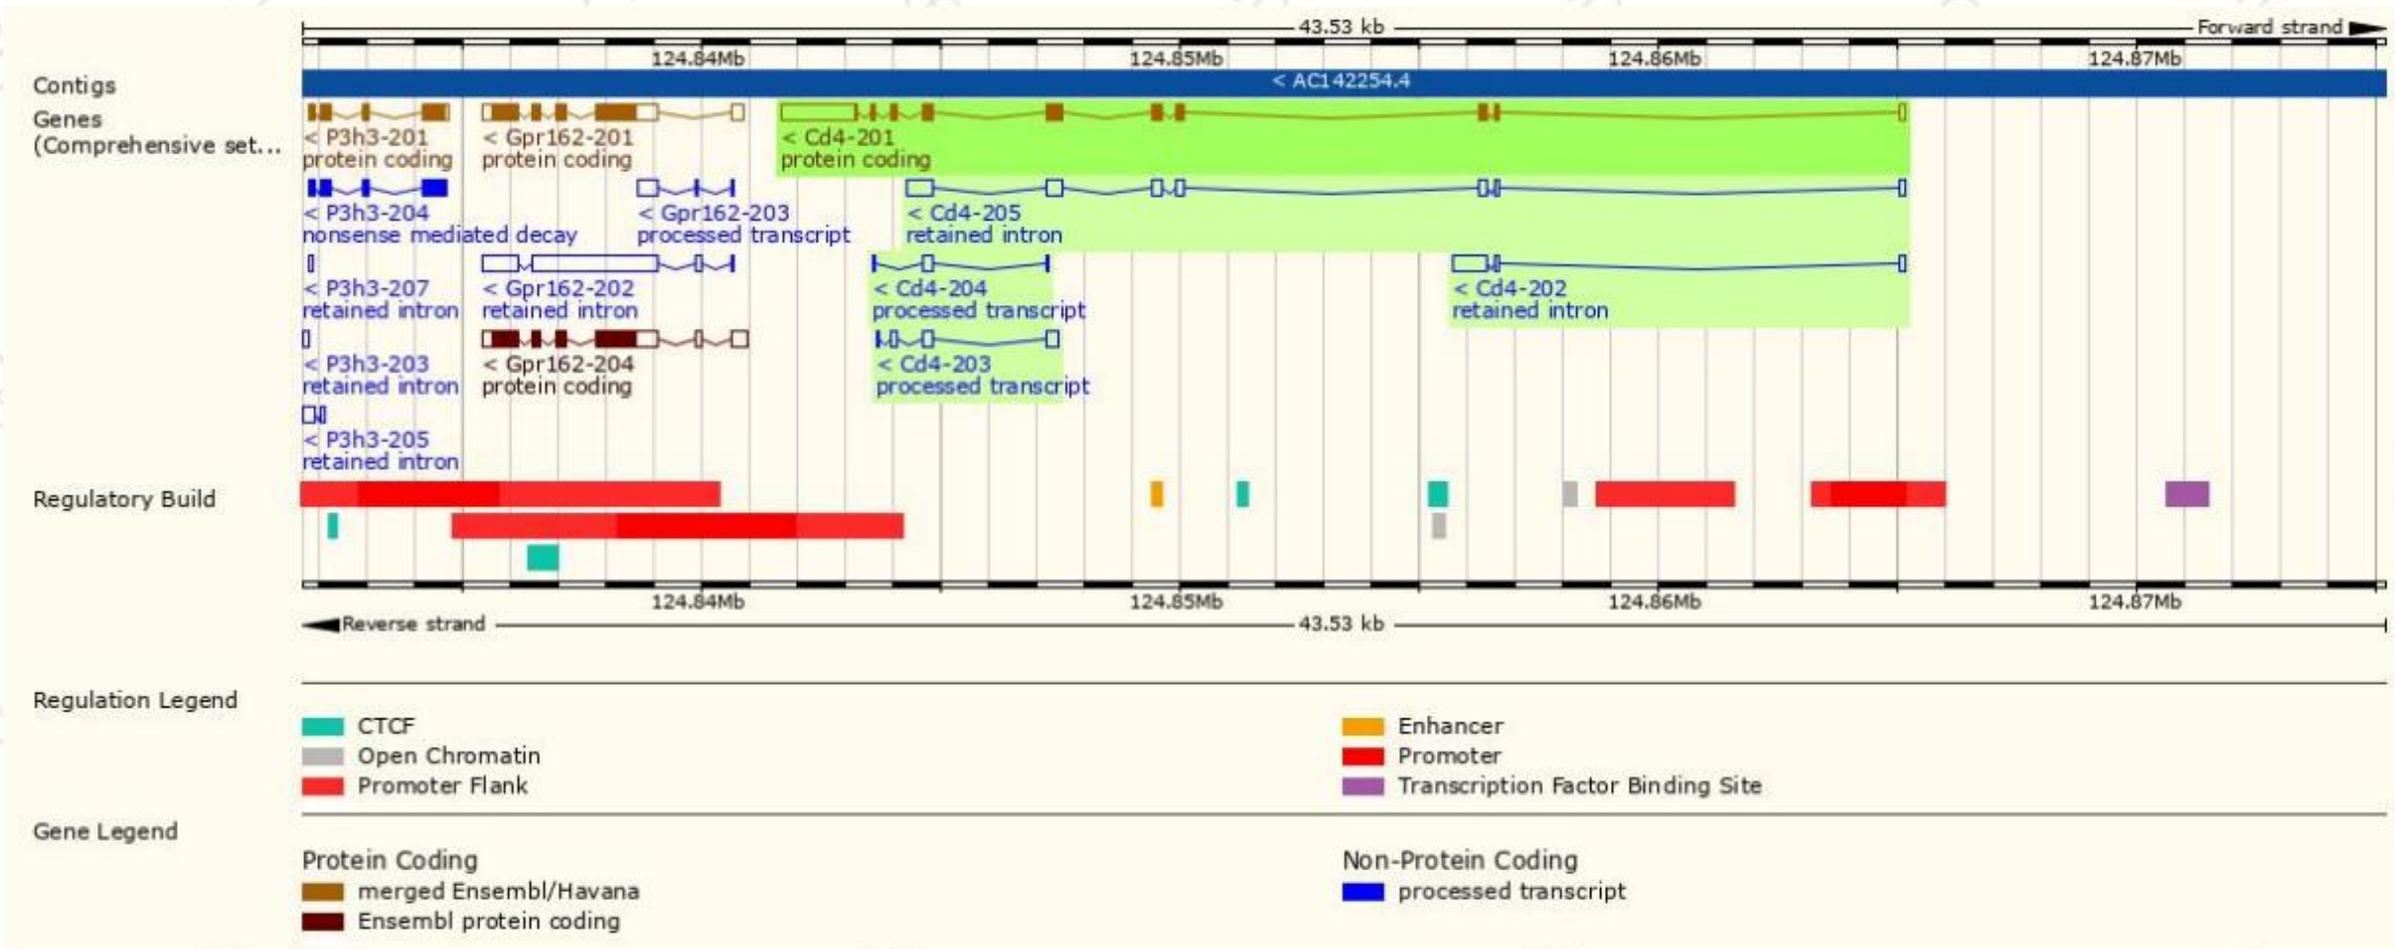

The gene has 5 transcripts, all transcriptional information is shown below:

Name	Transcript ID	bp	Protein	Biotype	CCDS	UniProt Match	Flags
Cd4-201	ENSMUST00000024044.7	3108	457aa	Protein coding	CCDS20535.0	P06332-1.0	GENCODE basic APPRIS P1 TSL:1
Cd4-203	ENSMUST00000145818.2	591	No protein	Processed transcript	-	-	TSL:5
Cd4-204	ENSMUST00000145977.8	273	No protein	Processed transcript	-	-	TSL:1
Cd4-205	ENSMUST00000151594.8	1647	No protein	Retained intron	-	-	TSL:1
Cd4-202	ENSMUST00000130378.2	946	No protein	Retained intron	-	-	TSL:1

The strategy is based on *Cd4-201* transcript design, it contains 10 exons, the length of transcript is 3108bps, and encodes 457 amino acids.
