# Knockout strategy

This model will use CRISPR/Cas9 technology to edit the *Micul* gene. The schematic diagram is as follows:

# Technical routes

- The *Micul* gene has 12 transcripts, According to the structure of *Micul* gene, exon3-exon5 of *Micul*-201 transcript is recommended as the knockout region. The region contains the 382bp coding sequence. Knock out the region, result in destruction of protein.
- This project uses CRISPR/Cas9 technology to modify *Micul* gene. The brief process is as follows: sgRNA was transcribed in vitro, Cas9, sgRNA were microinjected into fertilized eggs of C57BL/6JGpt mice and homologous recombination was carried out to obtain F0 mice. A stable and hereditary F1 generation mouse model was obtained by mating F0 generation mice with C57BL/6JGpt mice which were confirmed positive by PCR-sequencing.

# Notice

- The *Micul* gene is located in the Chr10. If the knockout mice are mixed with other mice, two target genes are avoided on the same chromosome as possible, otherwise the offspring of mice with double gene positive and homozygous gene knockout can not be obtained.
- This Strategy is designed based on genetic information in existing databases. Due to the complexity of gene transcription and translation processes, all risks cannot be predicted under existing information.
